WHAT IS CLAIMED IS:

1. A training assistant system comprising:

a training task presentation unit for presenting a training task and a training content to a trainee;

5   a trainee's response collection unit capable of collecting, from the trainee, a response in accordance with the training task and the training content;

a brain activity measurement unit for measuring brain activity of the trainee; and

10   an information processor for controlling the presentation by said training task presentation unit and determining a next training task to be performed such that at least a result of the response obtained from said trainee's response collection unit and a

15   result of measuring the brain activity of the trainee in a training execution process, which is obtained from said brain activity measurement unit, are reflected in the next training task to be performed.

2. A training assistant system according to claim

20   1, wherein said brain activity measurement unit is capable of measuring the brain activity at each of a plurality of regions in a brain and has a unit for selecting, from among said plurality of regions, a region of interest used to evaluate a result of

25   training and determine the next training task to be performed.

3. A training assistant system according to claim 1, wherein said information processor controls said

training task presentation unit such that a task for
searching a region of interest, which is for selecting
a proper region of interest in a training process, is
presented prior to the presentation of said training
5   task.

4. A training assistant system according to claim
1, wherein said information processor is capable of
setting evaluation criteria for the result of training
the trainee and evaluates said result of training the
10   trainee based on the set evaluation criteria.
